                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an oligonucleotide anti-sense to e.g., initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide and optionally surfactant operatively linked to the oligonucleotide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonucleotide is useful for production of a medicament for the prevention and/or treatment of a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CP), chronic obstructive pulmonary diseases (CODD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway the present the control of the control 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codons and introns of respiratory disease-relevant genes e. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nyce JW, Ta
Shahabuddin
New 2'-O-aminoethylthioethyl-modified ribosyl nucleosides useful a monomer for the synthesis of modified anti-sense oligonucleotides.
                                                                                                                                                                                                                                                                         07-AUG-1998;

                                                                                 The invention relates to 2'-O-aminoethylthioethyl-modified ribosyl nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful in diagnosis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistance towards nucleases. This sequence represents a modified
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleosides. The modified ribosyl nucleosides are used as monomers for the synthesis of modified antisense oligonucleotides, which are useful ir shapposis and therapeutics (e.g. in gene therapy, for treating organisms having a disease associated by the undesired production of proteins) and as research reagents. The oligonucleotides obtained from the monomers show enhanced hybrid binding affinity towards targeted DNA or RNA and resistance towards nucleases. This sequence represents a modified antisense oligonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                               nanotube; (2) physically modifying (M2) a nanotube; (3) linking (M3) nanotubes; (4) a several linked nanotubes (II) produced by (M3); (5) directing (M4) nanotubes to specific targets; (6) a nucleic acid sensor (III) comprising (I), where the base sequence of the attached nucleic acid molecule is substantially complementary to all or a portion of the base sequence of the nucleic acid molecules being detected; (7) a DNA array consisting of an array of groups of one or more nanotubes, each group having one or more nucleic acid molecules of the same base sequence
used as a biosensor for detecting complementary musers bacterial or useful in clinical application for screening presence of bacterial or viral nucleic acid, in pharmaceutical applications, agricultural applications, food control, hygiene and environmental monitoring and forensic applications. (II) is useful as a nano-scale conductor or semiconductor, more specifically as a component in nano-electronic applications, as a replacement for damaged nerves in prostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nanotube; nucleic acid sensor; DNA array; conductor; nanoparticle; biosensor; detection; screening; bacterial; viral; pharmaceutical; agricultural; food control; hygiene; environmental; forensic; nano-scale conductor; semiconductor; nano-electronic; prostatic nerve;
                                                                                                                                                                                                                                                                            attached to each nanotubes in the group, and where the base sequence of the nucleic acid molecules, attached to the nanotubes in one group differs from those in other groups so that a number of different target DNA molecules may be detected; (8) an actuator comprising (I) and a membrane support to which the DNA-modified nanotubes are attached; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a nanotube (I) attached with one or more nucleic acid molecule(s). Also described: (1) chemically modifying (M1) concerns. (2) physically modifying (M2) a nanotube; (3) linking (M3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Carbon nanotube attached with one or more nucleic acid molecules, as biosensor for screening presence of bacterial or viral nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 03-JUN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ADM42087
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADM42087 standard; DNA; 19 BP
                                                                                                                                     (9) a conductor (IV) comprising (1) (1) is useful in coating one or manotubes with nanoparticles, which involves exposing (1) to nanoparticles comprising several attached complementary nucleic acid molecules, where the nanoparticles hybridise to the nucleic acid molecules on the surface of the nanotube(8) as well as self-annealing other nanoparticles, forming one or more coated nanotubes. (1) can be used as a biosensor for detecting complementary nucleic acid strands,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        30-AUG-2002; 2002AU-00951274.

(II) can also be used as a transistor or gated device. The present sequence represents an oligonucleotide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ADM47150;
                   The invention relates to nucleoside compounds. The nucleoside compounds are useful as antisense compounds in diagnostics, therapeutics, prophylaxis, and as research reagents and kits, and to prevent or delay infection, inflammation or tumour formation. The compounds have enhanced binding affinity properties. The present sequence represents a 2'-O-MOE, thio modified oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      ss; antisense; infection; enhanced binding affinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2'-O-MOE-2-thio modified oligonucleotide

                                                                                                                                                                                                                                                             The invention relates to 2'. O-modified ribosyl nucleosides and methods enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research
                                                                                                                                                                                                                                                                                                                                                Enhancing renal uptake of an oligomeric compound in the diagnostic and therapeutic applications involves incorporating at least one modified ribosyl nucleoside into the oligomeric compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligonucleotide #4 used in animal studies
                                                                                                                                                                                          Sequence 19
                                                                                                                                                                                                               reagents; and for treating infection caused by organisms (e.g. bacte. yeast, protozoa and algae) in plants and higher animals. The present sequence is an oligonucleocide used in animal studies. This sequence used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Unidentified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ADO58963;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ADO58963 standard;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to 2'-O-modified ribosyl nucleosides and methods of enhancing renal uptake of an oligomeric compound. The method is useful for enhancing renal uptake of an oligomeric compound. The sequences of the invention are useful in diagnostics, therapeutics and as research reagents; and for treating infection caused by organisms (e.g. bacteria, yeast, protozoa and algae) in plants and higher animals. The present sequence is an oligomucleotide used to illustrate enzymatic degradation of 2'-O-modified oligomers. This sequence is used to illustrate the

The invention relates to oligonucleotides anti-sense to an initiation cc codon, coding region, 5' or 3' intron-exon junction, intron or region cc with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL) 4 receptor, interleukin (IL) 5' receptor, CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to come or more nucleic acid target(s) or expressed product(s), for the CC oligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Ectaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The CC cand/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with cc inflammation or an inflammatory disease. The respiratory or lung disease (CP), chronic obstructive pulmonary disease (COPD), callergic rhinitis, acute respiratory diseases syndrome, pulmonary controloconstriction. This sequence represents an oligonucleotide of the

RESULT 1818
         The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region CC with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target CC chosen from a gene encoding interleukin (II)-4 receptor, interleukin (II)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, CC tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC coligonucleotides are useful for reducing or inhibiting expression of a CC gene or mRNA encoding interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are cuseful for preventing or treating a respiratory or lung disease. The CC and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with cc inflammation or an inflammatory disease. The respiratory or lung disease (CPD), chronic obstructive pulmonary disease (CPDD), called the pulmonary disease (CPDD), called the pulmonary disease condered the constitutive pulmonary and constitutive pulmonary and constitutive pulmonary and constitutive pulmonary disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; 88; interleukin-4 receptor; IL-4; interleukin-5 receptor; IL-1 (CR1; CCR3; Eotaxin-1; RANTES; MCP4; CD23; ICAM; VCAM; tryptase a; tryptase b; PD54 A; PD54 B; PD54 C; PD54 D; respiratory disease; lung disease; hyper-responsiveness; adenosine; adenosine A receptor; asthma; lung allergy; inflammation; inflammatory disease; airway inflammation; allergy; impeded respiration; cystic fibrosis; chronic obstructive pulmonary disease; COPD; allergic rhinitis; acute respiratory distress syndrome; pulmonary hypertension;

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL)-5 receptor, CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, tryptase b, PDE4 A, PDE4 B, PDE4 C or PDE4 D. The invention
                                                                                                                                 Novel single or multiple target oligonucleotide anti-sense to e.g. initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human oligonucleotide #2403.
                                                                                                                                                                                                                                                                                                                                                                              23-APR-2002; 2002WO-US013135

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC also relates to a method of screening a candidate compound that binds to one or more nucleic acid target(s) or expressed product(s), for the CC prevention and/or treatment of a respiratory or lung disease. The CC oligonucleotides are useful for reducing or inhibiting expression of a CC cross and/or interleukin-4 receptor, interleukin-5 receptor, CC CCR1, CCR3, Eotaxin-1, RANTES, MCP4, CD23, ICAM, VCAM, tryptase a, CC tryptase b, PDE4 h, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are CC useful for preventing or treating a respiratory or lung disease. The CC respiratory or lung disease is associated with hyper-responsiveness to C and/or increased levels of, adenosine and/or levels of adenosine A CC receptor(s), and/or asthma and/or lung allergies associated with CC inflammation or an inflammatory disease. The respiratory or lung disease C schosen from airway inflammation, allergy, asthma, impeded respiration, CC cystic fibrosis (CF), chronic obstructive pulmonary disease (CPD),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of breast cancer which comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The method of the invention has cytostatic applications and may be useful for identifying a risk of breast cancer, as well as therapeutic and prophylactic treatments that specifically target breast cancer, such as gene therapy. The current sequence is that of an Extend primer of the invention which was used to genotype single nucleotide polymorphisms within human glycoprotein VI (platelet) (GP6; GPIV;GPVI) DNA which is located at chromosomal position 19q13.4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk of breast cancer by detecting or absence of one or more nucleotide polymorphic variations, diagnosing, preventing and/or treating breast cancer.
The invention relates to an isolated nucleic acid molecule (1), comprising a nucleic acid sequence chosen from 75 Nicotiana-derived cytochrome P450 enzyme fragment sequences. (I) is useful for producing a transgenic tobacco plant, which involves operably linking (I) with a promoter functional in the plant to create a plant transformation vector, and transforming the plant with the plant transformation vector,
                                                                                                                                                                                  WPI;

                                                                                                                                                                                                                                                               The present invention relates to identifying an eRNA or a DNA sequence comprising an eRNA-encoding sequence in the nucleome of a eukaryotic cell comprises identifying non-protein-encoding nucleotide sequences within an mRNA transcript or a DNA sequence encoding same in the nucleome. The methods are useful for identifying an eRNA or DNA for modifying a genetic network in cell to alter the cells phenotype. The present sequence represents human oligonucleotide sequence enquiry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   regenerating a plant from the selected plant cell. The nucleic acid molecule is in an antisense orientation, sense orientation or is in a RNA interference orientation. The present sequence represents a PCR primer used to clone DNA encoding tobacco cytochrome P450 enzyme fragments of

                                                                                                                                                                                                                                                                                                                                        The invention relates to a method of identifying a subject at risk of melanoma comprising detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject. Preventing melanoma in a subject comprises detecting the presence or absence of one or more polymorphic variations associated with melanoma in a nucleic acid sample from a subject; and administering a melanoma preventative to a subject in need thereof based upon the presence or absence of the one or more polymorphic variations in the nucleic acid sample. The preventative reduces ultraviolet (UV) light exposure to the subject. The methods, nucleic acids, proteins, and compositions are useful for treating melanoma. The present sequence
                            Human SNP flanking oligonucleotide SEQ ID 1204.

The present invention concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a configuration sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or conditions and for genotyping nucleic acid samples, for e.g. to cases by association analysis the genotypic trait suspected of being caused by one or more SNPs. Phenotypic trait include diseases e.g. cased by one or more SNPs. Phenotypic trait include diseases e.g. capammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cystrophy, familial hypercholestervolaemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial configuration, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and configuration of the method is also useful in forensic investigations and configuration and configuration of the method is also useful in forensic investigations and configuration of the method is also useful in forensic investigations and configuration and configuration of the method is also useful in forensic investigations and configuration of the method is also useful in forensic investigations and configuration and configuration of the method is also useful in forensic investigations and configuration of the method is also useful in forensic investigations and configuration configuration of the method is also useful in forensic investigations and configuration of the method is also useful in featur

New isolated nucleic acid segments from the human determining polymorphic forms for use in e.g. for testing or phenotypic typing for disease. forensics, paternity genome used for

Claim 16; Page 220; 310pp; English.

AAX09121-X10268 are allele-specific oligonucleotide primers used in the isolation of various biallelic polymorphic markers found in the human CC genome (represented in AAX10269-X12937). These primers can be used in a CC method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such CC as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular CC dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial CC hypercholesterolenia, polycystic kidney disease, hereditary the percholesterolenia, polycystic kidney disease, hereditary Spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary compensation, polycystic kidney disease, hereditary chaemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos cystem, osteogenesis imperfecta, acute intermittent porphyria, cautoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such CC system, infection by pathogenic microorganisms, and characteristics such CC system, appearance (e.g. baldness, obesity), strength, speed, CC endurance, fertility, and susceptibility or receptivity to particular corrections can also be used to produce medicaments for the treatment or receptivity are of such diseases. prophylaxis of **Buch** diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17655 to AAA18355 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 to AAA19155 to AAA19222 represent their corresponding target sequences; AAA19233 to AAA19233 to AAA23501 to AAA21555 represent ribozyme sequences; CC AAA19233 to AAA23501 to AAA21555 represent ribozyme sequences; CC AAA19233 to AAA221501 to AAA21555 represent ribozyme sequences; CC AAA19233 to AAA221501 to AAA2155 represent ribozyme sequences; CC AAA21689 to AAA22168 represent their corresponding target sequences; CC AAA21689 to AAA22163 to AAA23363 to AAA23427 represent ribozymes of CC AAA21689 to AAA22165 and AAA23363 to AAA23142 represent ribozymes of CC AAA23422 represent their corresponding target sequences; The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are CC especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as coversed and other syndrome, and diseases related to the levels of ARNT, Tie-2, integrin subunit beta-3 or integrin subunit bera-3 or

                                                                                                                                                                               The present invention describes enzymatic nucleic acid molecules with RNA Cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17188 to AAA17560 and AAA17622 represent ribozyme sequences for ARNT, CC corresponding target sequences; AAA17685 to AAA19835 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA19223 to AAA21961 and AAA21501 to AAA21555 represent ribozyme sequences; CC AAA19223 to AAA21563 and AAA21501 to AAA21555 represent ribozyme sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21680 represent their corresponding target sequences; CC AAA21422 represent their corresponding target sequences; CC AAA23422 represent their corresponding target sequences; CC AAA23422 represent their corresponding target sequences; CC AAA23422 represent their corresponding target sequences; CC CAAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC cabbility of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are cspecially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as sequences, CC syndrome, of tuberous sclerosis, pot-wine stains, Sturge Weber collegences, CC and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin submit beta 3 gene, an integrin alpha 6 submit gene, or a Tie-2 gene. AAA1675 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17650 and AAA17625 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences; AAA17685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA192361 and AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21596 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequences for integrin subunit beta 3, and AAA23476 AAA23363, AAA23343 to AAA23343 to AAA23343 to AAA23343 to AAA23343 to AAA23343 sequences for integrin subunit beta 3, and AAA23476 to AAA23362, AAA233343 to AAA23343 represent ribozyme sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; AKMU; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot wine stain; Sturge Weber syndrome; tuberous sclerosis; pot wine stain; Sturge Weber syndrome;
                                                                                                                                                                                                                        AAA23422 represent their corresponding target sequences. The ribozymes the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; anglogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; anglogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARND;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WO9950403-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss

AAA22832
CC cleaving activity, which specifically cleave RNA encoded by an aryl CC cleaving activity, which specifically cleave RNA encoded by an aryl CC gene, an integrin alpha 6 subunit gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tia-2 gene AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17685 to AAA16985 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA18985 to AAA19086 CC AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA19154 represent ribozyme sequences for integrin alpha 6 subunit, and AAA2365 represent ribozyme cC AAA21595 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21595 to AAA21688 represent their corresponding target sequences; CC AAA21595 to AAA21688 represent their corresponding target sequences; CC AAA21695 to AAA22475 and AAA2363 to AAA2362 represent ribozyme sequence; CC AAA21695 to AAA22475 and AAA2363 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to CC AAA23422 represent their corresponding target sequences. The ribozymes of CC integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are cited and corresponding target sequences. They are cegeially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as corresponding target sequences. Sugarome, Kippel-Trenaunay-Weber syndrome, Obler-Weber-Rendu syndrome, conductors, subunit alpha-6, or rice related conductors, subunit alpha-6 or cruca wulgaris, and other syndromes and disease related to the levels of ARMT, Tie-2, integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; 88
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma;

                                                              Cleaving activity, which specifically cleave RNA encoded by an aryl chydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 cg gene, an integrin alpha 6 subunit gene, or a Tito-2 gene. AAA1675 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, cand AAA17168 to AAA17168 to AAA17623 to AAA17685 to AAA18385 and AAA19087 to C corresponding target sequences; AAA17685 to AAA18385 and AAA19086 cand AAA19154 represent ribozyme sequences for Tie-2, and AAA18385 and AAA19086 cand AAA19155 to AAA19222 represent their corresponding target sequences; AAA19154 represent ribozyme sequences for Tie-2, and AAA18385 to AAA19086 cand AAA19155 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences; AAA19223 to AAA20361 and AAA21501 to AAA21595 represent ribozyme sequences; AAA18385 to AAA21598 represent their corresponding target sequences; AAA21596 to AAA21588 represent their corresponding target sequences; AAA21595 to AAA21689 to AAA22363 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22376 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22376 to AAA23343 to AAA23422 represent their corresponding target sequences of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, corresponding target sequences of che invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially are related corresponding target sequences. The ribozyme sequence stability of an mRNA encoding angiogenic factor, especially are related macular degeneration (ARMD), inflammation, and arthritis, as well as chevascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, and other syndrome, oller weber-Rendu syndrome, and other syndrome, oller weber-Rendu syndrome, integrin subunit beta 5, integrin subunit beta 6 arthritis as well as cherosponders of the sequences of areas of a favor of the sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antigoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; ss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
       The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC aAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17650 and AAA17655 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences, ACA17685 to AAA18385 and AAA19087 to CC AAA19155 to AAA19222 represent their corresponding target sequences, CC aAA19232 to AAA19222 represent their corresponding target sequences, CC aAA19223 to AAA21561 and AAA21561 to AAA21555 represent ribozyme CC AAA19223 to AAA21688 represent their corresponding target sequences, CC AAA21689 to AAA21688 represent their corresponding target sequences, CC AAA21689 to AAA21688 represent their corresponding target sequences, CC AAA21689 to AAA2168 represent their corresponding target sequences, CC CAA21689 to AAA2168 represent their corresponding target sequences, CC CAA21689 to AAA2168 represent their corresponding target sequences, CC CAA21689 to AAA2168 represent their corresponding target sequences. The ribozyme of CC caaa19222 represent their corresponding target sequences. The ribozymes of CC caaa1922476 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC cabacially used to treat cancer, diabetic retinopathy, age related CC especially used to treat cancer, diabetic retinopathy, age related CC especially used to treat cancer, diabetic retinopathy, age related concours of the invention and archine services of the invention of this course of the invention and archine services where the course course of the invention and archine services.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ş
       The present invention describes enzymatic nucleic acid molecules with RNA CC cleaving activity, which specifically cleave RNA encoded by an aryl CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 CC gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17563 and AAA17623 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18985 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19886 to AAA19086 CC AAA19155 to AAA19222 represent their corresponding target sequences; CC CAA19155 to AAA19222 represent to AAA21501 to AAA21500 and CC CAA21596 to AAA21688 represent their corresponding target sequences; CC CAA21596 to AAA21688 represent their corresponding target sequences; CC CAA21689 to AAA22461 and AAA22363 to AAA23343 to CC CAA23422 represent their corresponding target sequences; CC CAA21689 to AAA22475 and AAA23263 to AAA23343 to CC CAA23422 represent their corresponding target sequences. The ribozymes of CC CAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or carefullity of an modula encoding the synthesis, expression and/or carefullity of an modula encoding the synthesis, expression and/or carefullity of an modula encoding the synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

```

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17563 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18885 and AAA19087 to AAA19125 represent tribozyme sequences; and AAA19155 to AAA19223 to AAA19223 represent their corresponding target sequences for Tie-2, and AAA18386 to AAA19086 and AAA19223 to AAA192361 and AAA191501 to AAA21505 represent ribozyme sequences for Tie-3ranies for

to AAA21688

The ribozymes the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2,
The present invention describes enzymatic nucleic acid molecules with RN cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16755 to AAA17661 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17630 and AAA17633 to AAA17644 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 17
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAA22739 standard; RNA; 17

The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding anglogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17562 represent ribozyme sequences for ARNT, and AAA17168 to AAA17563 to AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19155 to AAA19227 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA21501 to AAA20362 to AAA21500 and AAA21506 to AAA21688 represent their corresponding target sequences; AAA21506 to AAA21688 represent their corresponding target sequences; AAA21506 to AAA22476 and AAA23263 to AAA23362, AAA23343 to AAA23363 and AAA22476 to AAA23363 to AAA2363 to AAA2363
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; angiogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; angiogenic factor; cytostatic; antidiabetic; ophthalmologic; antiinflammatory; antiarthritic; antipsoriatic; ARMD; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; degree related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;

The ribozymes the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl pydrocarbon nuclear transporter (ART) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ART, and AAA17168 to AAA17560 and AAA17623 to AAA18385 and AAA19087 to corresponding target sequences; AAA11684 represent their corresponding target sequences; AAA19685 to AAA18385 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA18386 to AAA19086 and AAA19155 to AAA22322 represent their corresponding target sequences; AAA19154 to AAA23361 and AAA21501 to AAA21595 represent ribozyme sequences; AAA19233 to AAA2368 argressent their corresponding target sequences; AAA21898 to AAA21688 represent their corresponding target sequences; AAA21898 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23465 to AAA23363, AAA23343 to AAA23465 to AAA22475 and AAA23465 to AAA23365 to AAA23665 to A
                                                                                                                                         AA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARWD), inflammation, and arthritis, as well as meovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and diseases related to the levels of ARNT, Tie-2, and other syndromes and other syndrome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 54; Page 240; 305pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 27-MAR-1998;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (RIBO-) RIBOZYME PHARM INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ribozymes for modulating the synthesis, mRNA encoding an angiogenic factors.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC cleaving activity, which specifically cleave RNA encoded by an aryl color hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17622 represent ribozyme sequences for AAA17164 and AAA17561 to AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 to AAA19123 to AAA20361 and AAA21501 to AAA21505 represent ribozyme corresponding target sequences; AAA17688 to AAA19223 to AAA20361 and AAA21501 to AAA21505 represent ribozyme corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21675 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA22362, AAA23343 to CC AAA21689 to AAA21687 and AAA22476 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to CC CC AAA21689 to AAA21680 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC stability of an mRNA encoding angiogenic factor, especially ARRT, CC corresponding target sequences. The ribozymes of the invention (ARMD), inflammation, and arthritis, as well as corresponding target sequences. They are CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, candother syndrome, and diseases related to the levels of ARNT, Tie-2, integrin subunit shere?
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

```
CC hydrocarbon nuclear transporter (ARNY) gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA17675 to CC AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, CC and AAA17661 to AAA17560 and AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC and AAA19155 to AAA19222 represent their corresponding target sequences; CC aAA19233 to AAA19222 represent their corresponding target sequences; CC AAA19233 to AAA21688 represent their corresponding target sequences; CC AAA19155 to AAA21688 represent their corresponding target sequences; CC AAA21696 to AAA21688 represent their corresponding target sequences; CC AAA21696 to AAA21698 represent their corresponding target sequences; CC AAA21699 to AAA22475 and AAA23263 to AAA2342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA23362, AAA23343 to CC AAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC stability of an mRNA encoding angiogenic factor, especially ARNT, C integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are c especially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as C meovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, C angiofibroma of tubercous sclerosis, pot-wine stains, Sturge Weber CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, integrin subunit barea, so ribrorin subunit barea, so ribr

                                                                                                                RESULT 1843
                                                                                                                                                                                                                                                                                                                                      CC cleaving activity, which specifically cleave RNA encoded by an aryl cleave range could by an aryl cleave RNA encoded by an aryl country gene, an integrin subunit beta 3 cc gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA1675 to AAA17622 represent ribozyme sequences for ARNT, CC corresponding target sequences. AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19086 to AAA19154 represent ribozyme sequences. CC AAA19155 to AAA20361 and AAA21501 to AAA218385 and AAA19086 CC AAA19223 to AAA20361 and AAA21501 to AAA21955 represent ribozyme sequences. CC cand control of the sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CC AAA21596 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA23476 to AAA23262, AAA23343 to CC CAAA23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or CC the invention are used for modulating the synthesis, expression and/or CC stability of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related CC mecular degeneration (ARMD), inflammation, and arthritis, as well as CC angiotibroma of tuberous sclerosis, pot-wine stains, Sturge Weber CC syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, CC integrin subunit alpha-6, or integrin subunit beta-3 or integrin subuni

Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves used with DNA) are combination of modifications in (A) improves the resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA25992 represent their corresponding target sequences. AAA26107 to AAA26107 to AAA2618 represent their corresponding target sequences. AAA2619 to AAA26271 represent other ribozyme sequences and anactisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonuclec gene expression modification; cancer; phosphorothioate; endc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytiquicleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, (a)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 77; Page 71; 148pp;

                                                                                                                                                                                                                                                                                                                                                             S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC with a target sequence and contain at least one phosphoro (di) thioatet (CC link, having endonuclease activity. (A), and more generally any catalytic (CC link, having endonuclease activity. (A), and more generally any catalytic (CC gene, are used to treat cancer (particularly of breast or endometrium), (CC in vivo or by transforming cells ex vivo and implanting treated cells, or (CC for other conditions associated with levels of oestrogen receptor. (CC gene, are used inhibition of gene expression with alterations in phenotype, (CC correlate inhibition of gene expression with alterations in phenotype, (CC particularly for identification of therapeutic targets, and as research (CC reagents (for RNA, in the same way that restriction endonucleases are (CC used with DNA). The combination of modifications in (A) improves (CC resistance to nucleases, binding affinity and/or activity. AAA23503 to (CC AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and (CC AAA24748) to AAA25092 represent their corresponding target sequences. (CC genences. and AAA26107 to AAA26107 and AAA26107 to AAA26107 to

Cg gene, are used to treat cancer (particularly of breast or endometrium), cc in vivo or by transforming cells ex vivo and implanting treated cells, or CC for other conditions associated with levels of bestrogen receptor. CC Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, cc particularly for identification of therapeutic targets, and as research CC reagents (for RNA, in the same way that restriction endomucleases are CC used with DNA). The combination of modifications in (A) improves CC resistance to nucleases, binding affinity and/or activity. AAA23503 to CAAA2474 represent oestrogen receptor hammerhead ribozyme sequences, and CC AAA2474 represent oestrogen receptor hammerhead ribozyme sequences. CC RAA24748 to AAA25992 represent their corresponding target sequences. AAA26219 to AAA26218 represent of the receptor hairpin ribozyme cc sequences. AAA26219 to AAA26271 represent other ribozyme sequences and cantisense oligonucleotides used in the exemplification of the present criventics.
                                                                                                                                                                                                                                                                                                                                     RESULT 1846
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor.

Correlate inhibition of gene expression with alterations in phenotype, carticularly for identification with alterations in phenotype, particularly for identification with alterations in phenotype, carticularly for identification of modifications in (A) improves reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent oestrogen receptor hammerhead ribozyme sequences, and AAA26305 represent their corresponding target sequences.

AAA24748 to AAA263105 represent their corresponding target sequences. AAA2593 to AAA263105 represent their corresponding target sequences. AAA263107 to AAA26211 represent their corresponding target sequences and attisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoletin, granulocyte colony stimulating factor protein and
                                             Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 17 BP; 2 A; 0 C; 1 G; 0 T; 14 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.

ID ABT3940
The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement confined and of the invention are useful as probes and primers for detecting, cands of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TP-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             schizophrenia;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              용
              The invention relates to a novel isolated 17 mer nucleic acid sequence, cc given in the specification, a sequence containing at least 15 consecutive cc nucleotides from the 17 mer sequence, a sequence with, after optimal cc alignment, at least 80 % identity to the 17 mer sequence that cc Alignment, at least 80 % identity to the 17 mer sequence, a sequence that cc of any of them, or the corresponding RNA. The novel isolated nucleic cc acids of the invention are useful as probes and primers for detecting, cc identifying, quantifying and/or amplifying a nucleic acid, e.g. as one cc component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, colls containing the vector or antibodies directed against the polypeptides are useful for c preparation of pharmaceuticals for prevention and/or treatment of viral cdiseases that are characterised by development of tumours or cell containing the expression of the 17 mer nucleic acids in schizophrenia. Analysis of the expression of the 17 mer nucleic acids in the containing the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            schizophrenia. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene antisense; sense; tumour; cell degeneration; cancer; Alzheimer's dis schizophrenia; protein chip; gene therapy; tumour suppression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 4 A; 7 C; 3

The invention relates to a novel isolated 17 mer nucleic acid sequence, conversions in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement coff any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the nucleic acids, cells containing the corresponding vectors containing the nucleic acids, cells containing the corresponding to the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in gatient samples is useful for diagnosis and/or prognosis of these containing the useful to penerate antibodies, and both the polypeptide and antibodies are useful as components of protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression related human fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 17 BP; 1 A; 6 C; 5 G; 5 T; 0 U; 0 Other;

cc given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC acids of the invention are useful as probes and primers for detecting, CC identifying, quantifying and/or amplifying a nucleic acid, e.g. as one CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cp polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell components. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for diagnosis and/or prognosis of these chips. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour surcein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ន្តន្តន្តន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁

                                                      nucleotides from the 17 mer sequence, a sequence with, after optimal controlled from the 17 mer sequence, a sequence with, after optimal conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cacids of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying and primers for detecting, component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral containing that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and components is useful for diagnosis and/or prognosis of these containing the polypeptides are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the polypeptide and antibodies are useful as components of protein containing the inventor management of the polypeptide and antibodies are useful as components of protein containing the inventor management of the containing the containing the polypeptides and antibodies are useful as components of protein containing the inventor management of the containing the component of the containing the containing the containing the conta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RESULT 1854
ABT38728/c
                                                    Cg given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal CC alignment, at least 80 % identity to the 17 mer sequence, a sequence that CC hybridizes to them under highly stringent conditions, or the complement CC drief of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, CC component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, CC production of recombinant polypeptides. Any of the nucleic acids, CC production of pharmaceuticals for prevention and/or treatment of viral CC diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and CC gatient samples is useful for diagnosis and/or prognosis of these CC diseases. The polypeptides can also be used to generate antibodies, and oth the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene theraw. This polymelactide sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match
